# Practical 10: Interactive Dashboard, RLS and Power Platform

**Name:** _____ **Roll No.:** _____ **Date:** _____

## Aim

Build an interactive report, apply Row-Level Security, and integrate Power Automate and Power Apps.

## Procedure

**1.** Add Year and Region slicers; drill-through page **Store Detail** (Store Name); two bookmarks with buttons (chart/table view).

**2.** Modeling > Manage roles: create North Manager and South Manager (filters below).

**3.** Test with **View as**.

**4.** Publish; assign test accounts to roles (dataset > Security); pin Total Sales card to a dashboard.

**5.** Set a data alert; create a Power Automate flow (trigger: *When a data driven alert is triggered*) to send email/Teams message.

**6.** Add a Power Apps visual (Store Name, Sales Amount) > Create new.

## RLS filters (DAX)

```
North Manager:  Store[Region] = "North"
South Manager:  Store[Region] = "South"
```

## Output (sample data)

| View as | Regions visible | Total Sales |
|---|---|---|
| No role | East, North, South, West | 139,795 |
| North Manager | North | 27,754 |
| South Manager | South | 30,295 |

**Result:** slicers, drill-through and bookmarks work; each role sees only its region; alert triggers the flow; Power Apps visual updates with the selected store. (Steps 4-6 need Pro/PPU and a work/school account.)

## Viva Answers

**What is RLS?** Restricts rows per user; roles use DAX filters (Modeling > Manage roles) and users are assigned in the service.

**Test RLS?** View as (Desktop) / Test as role (service).

**Drill-through?** Detail page filtered by the selected item.

**Automate / Apps?** Automate sends alerts/workflows; Apps embeds an app using report context.
