Practical 7: Import and Transform RetailPulse Data

Name: _____ Roll No.: _____ Date: _____

Aim

Import RetailPulse data into Power BI Desktop and clean it with Power Query.

Procedure

1. Home > Get data > Excel > select Sales, Product, Store > **Transform Data**.

2. Set types: Sales Date = Date, Quantity = Whole Number, Sales Amount = Fixed decimal.

3. Remove Blank Rows; Remove Duplicates; replace null Quantity with 0; rename Qty → Quantity, Sales Amt → Sales Amount.

4. Add Conditional Column **Sale Size** (Sales Amount >= 1000 → Large, else Standard).

5. Close & Apply; save as **RetailPulse_Analysis.pbix**.

Code (M)

```
each if [Sales Amount] >= 1000 then "Large" else "Standard"
```

Applied Steps: Source, Navigation, Changed Type, Removed Blank Rows, Removed Duplicates, Replaced Value, Added Conditional Column.

Output (sample data)

	Before	After
Rows	157	150
Blank rows	3	0
Duplicates	4	0
Null Quantity	5	0
Sale Size	-	Large 46 / Standard 104

Result: all tables load without errors; types correct; data clean; Applied Steps re-run on refresh.

Viva Answers

Import vs DirectQuery? Import stores data in the model (fast); DirectQuery queries the source live (current, slower).

Applied Steps? Recorded, repeatable list of transformations.

View for relationships? Model view.

Why set data types? Correct calculations, sorting and date features.
